

My Career Purpose (NORTH STAR)

I want to build technology that creates meaningful impact while fostering a trustworthy and collaborative environment. My goal is to grow into an IT professional who can connect technology, people, and business needs effectively to solve real problems and improve the way organization work. In the long term, I aspire to become a technology leader who continuously learns, adapts, and contributes not only through technical expertise, but also by helping teams grow, collaborate, and create positive impact together.

My Strength

I bring a strong technical foundation in fullstack software engineering across frontend frameworks like React and Next.js, backend technologies like NestJS and Golang, and robust cloud deployment pipelines. This is backed by my hands-on industry experience and Computer Science degree, allowing me to tackle complex engineering challenges and deliver reliable, scalable web applications.

My Area of Development

I am actively working on expanding my expertise by bridging software engineering (fullstack microservices, NestJS, Golang, and CI/CD pipelines) with enterprise IT support and infrastructure management (Mikrotik/Ubiquiti networking, hardware diagnostics, and system reliability). Deepening these combined technical competencies will allow me to better optimize large-scale backend operations, maintain high server uptime, and support mission-critical banking environments.

My Commitment to Kickstart My Career Sprint (How To Get There)

I will accelerate my impact by mastering core enterprise technologies, security protocols, and scalable deployment pipelines during onboarding. By proactively collaborating with cross-functional teams and aligning my technical output with business goals, I will drive high-performance results and continuous team growth.
